YOUR HOMEWORK:
IDENTIFY YOUR STRUGGLE

skool

Abuzaffar Sonde • 6d

One struggle I face in my identity is living up to my spiritual values in every situation. My faith teaches me patience, humility, and gratitude, yet in moments of hardship or pressure, I find myself slipping into stress and doubt. The misalignment troubles me, but I see it as a reminder that growth is a journey. Each struggle is also an opportunity to return back to my values and strengthen my connection with them.

8 Reply

Imran Khan • 6d

Struggle with controlling my body/weight mainly, and underlying ego/lack of discipline also. Mind struggles to focus for consistent progress with the neurodiversity I've recently been getting to grips with.

7 Reply

Sabrina Ganger • 6d (edited)

I struggle with my mind and at times my emotions. In terms of my mind I don't believe in myself, I feel incapable of living/ creating my dreams, its mainly based on fears of failure. In terms of my emotions I can get impatient and frustrated with people situations and find it hard to manage my emotions.

Melva Toussaint • 6d

I struggle with consistency, finishing a project before moving on to another and achieving the goals I want to achieve

skool

Rushna Khanom • 6d

I would say I am too empathetic at times and that can be challenging for me because others know I am an generous person. I always help others but that's doesn't mean I can be taken advantage of.

Ilona Kmiecinska • 5d

I am overly idealistic. Having clear ideas about what's right and what's wrong I often think that everyone shares these fundamental principles – or, at least, that everyone should share these principles. So it can come as a genuine shock sometimes when people violate my core values, such as truth or justice.

6 Reply

Steve Stanier • 5d

I really value integrity and quite often I give myself a hard time as I don't see myself in the context of the high standard I have. It's exhausting!

On the other hand I have discovered that one of the most powerful ways to deal with these struggles is not to carry them alone, but to share them with the person you trust the most — (in my case my wife and kids). We have established a talking therapy session within our family, where once a week we all sit down and talk about our feelings and pour out all what's bothering each of us as individual. Hence in this moments when my identity feels misaligned with my values, she reminds me of the bless... See more

@Rowena Wilson Alhumdulilah (thanks to Allah) yes indeed, this isn't came out of nowhere but it's a result of enduring very hard and painful experiences of life. Now I am on a journey to help and teach myself first & foremost and on the way if possible do the same for others if they need my support and assistance. 🙂 hence, this is a reason I am here to get knowledge of life coach.

I work in a highly compassionate area but I seem to use all my patience, having to be nice to people etc up at work so when I get home and relax, I can sometime be a bit snappy and intolerant. So I need to work on that, just cos I'm done in, doesn't mean hubby has to suffer.

skool

Rene Gollenberg · 5d

I struggle with patience and overachievement. Patience with others when individuals behave in unjust or unkind ways. Patience with myself when I feel I am not achieving as much as I would like (linked to being an overachiever).

Razwana Kauser · 5d (edited)

I think people hide struggles and failures and a part of me probably did too at times , probably mostly in places of work
I think the fear of failure and actually going through failure are so stigmatised in our society that people do not like to share their difficulties, not because they feel shame, but mainly because there is a fear of how people and the society will see you, sharing your struggles can change the way people see you, there will be judgement and this can impact on how we see ourselves as individuals and sometimes that can sit negatively but not necessarily have consequences.

3 Reply

Rowena Wilson · 4d

@Razwana Kauser totally agree. Sometimes we are given lip service re: ' come and talk to me about your feelings' and there is the fear it will be used against u at a later date, such as in a performance review. Saying that, Mental Health in the workplace is a protected characteristic so from an employment view they cannot use this as a reason to penalise you.

I believe I'm working through my own identity struggle at present - mind! Eight years ago I left my career to have a family and become a 'mum' a new identity that I've hidden under but loved and so fortune to have been able to do that without work distractions, and whilst my core values have always remained I believe I am more aware of the importance of alignment with them and no longer wish to be part of the world I worked in before children. I am hugely passionate about people in general and h... See more

Good morning everyone,

As I was reading through all the comments, one thing stood out to me, most of us share the value of wanting to help others, even while struggling with our own sense of identity. What I find interesting is that many of us can recognise parts of who we are, but the real challenge seems to be aligning that identity with our values.

skool

Angie Velez · 3d

I would say I struggle with consistency, it gets really hard for me to complete some of the projects I decide to start with a lot of emphasis. Therefore there is a sense of failure afterwards.

3 Reply

Imran Khan · 2d

@Angie Velez I'm very much in this boat, so you're not alone by any measure. I recently received an ADHD diagnosis which has helped me understand my working patterns better, and in being kinder to myself also. With or without the diagnosis, it's been helpful to just appreciate that while I'm not to "blame" for certain wired-behaviours, I absolutely have the ability to 're-wire' them, which is now my journey ahead

Navigation-related structural change in the hippocampi of taxi drivers

E A Maguire [1], D G Gadian, I S Johnsrude, C D Good, J Ashburner, R S Frackowiak, C D Frith

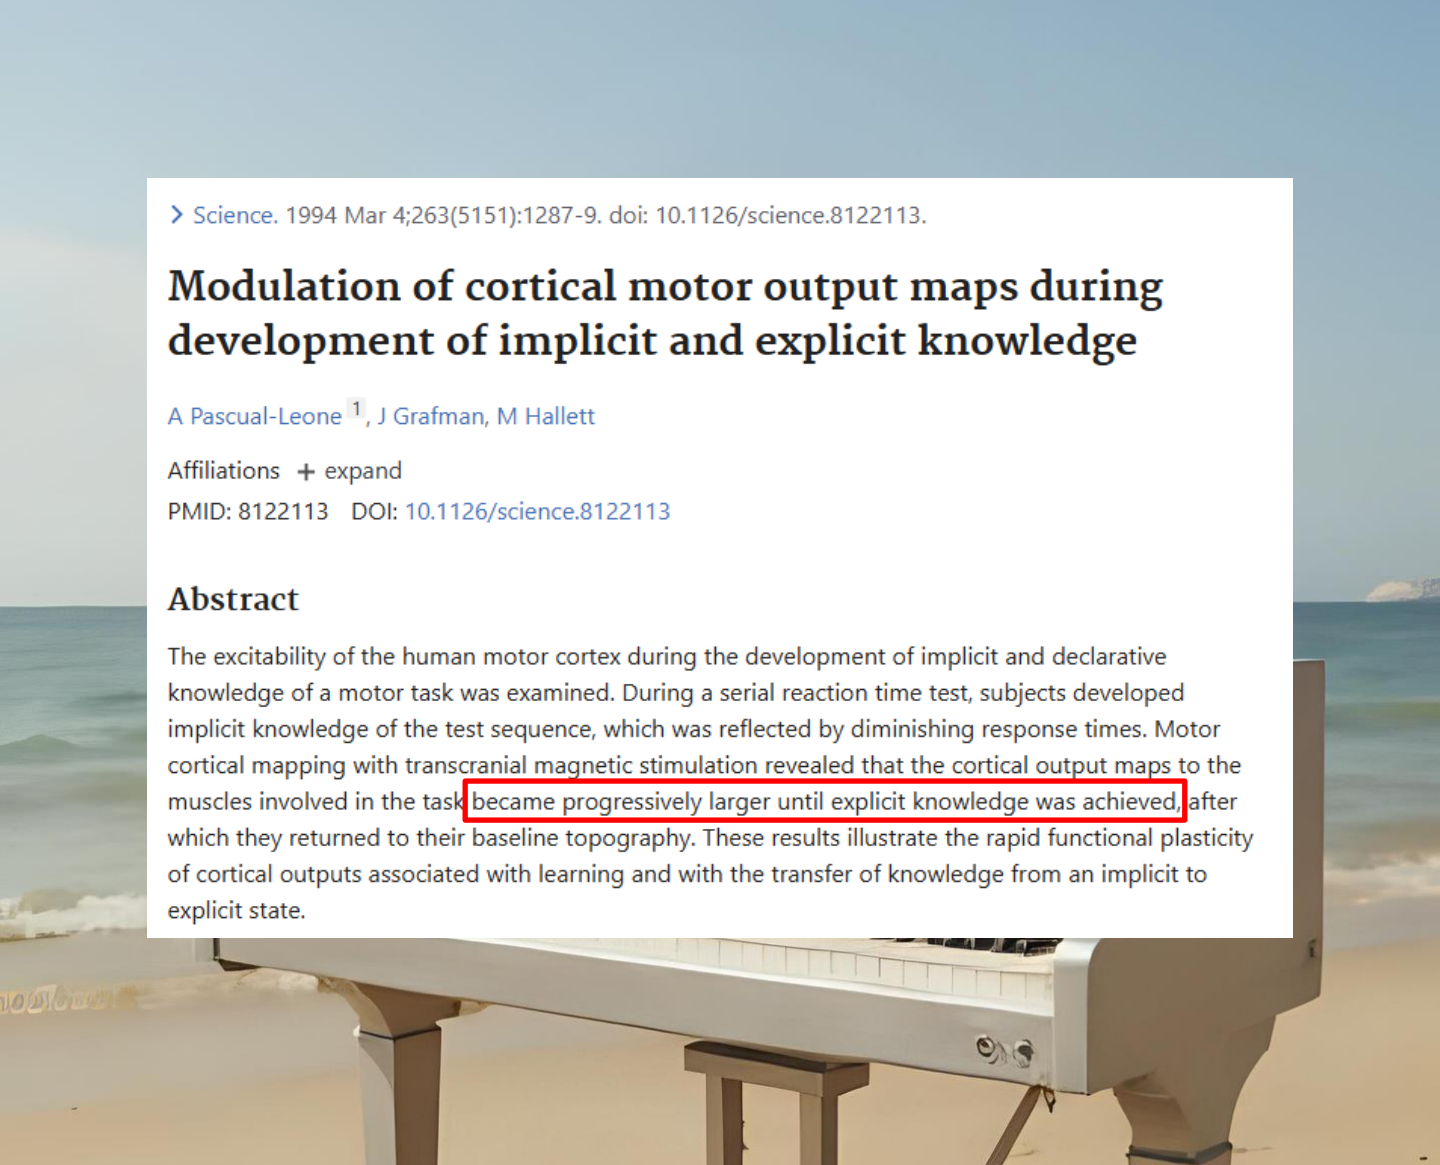

Affiliations + expand

PMID: 10716738 PMCID: PMC18253 DOI: 10.1073/pnas.070039597

Abstract

Structural MRIs of the brains of humans with extensive navigation experience, licensed London taxi drivers, were analyzed and compared with those of control subjects who did not drive taxis. The posterior hippocampi of taxi drivers were significantly larger relative to those of control subjects. A more anterior hippocampal region was larger in control subjects than in taxi drivers. Hippocampal volume correlated with the amount of time spent as a taxi driver (positively in the posterior and negatively in the anterior hippocampus). These data are in accordance with the idea that the posterior hippocampus stores a spatial representation of the environment and can expand regionally to accommodate elaboration of this representation in people with a high dependence on navigational skills. It seems that there is a capacity for local plastic change in the structure of the healthy adult human brain in response to environmental demands.

Modulation of cortical motor output maps during development of implicit and explicit knowledge

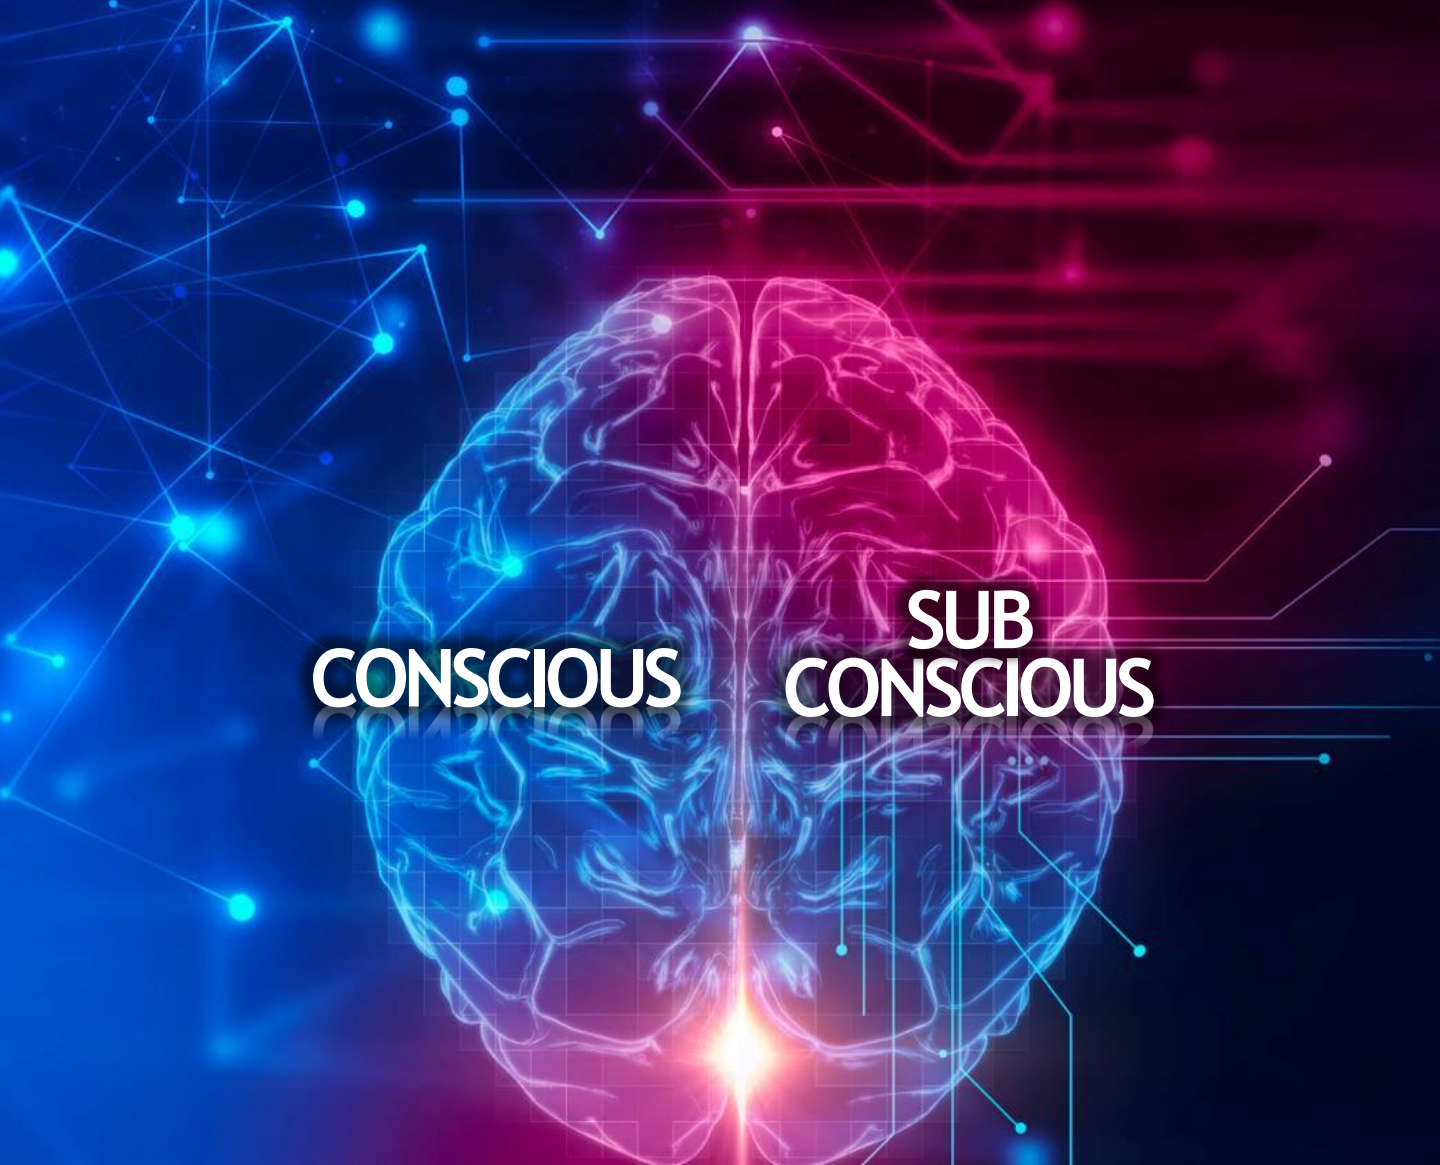

A Pascual-Leone [1], J Grafman, M Hallett

Affiliations + expand

PMID: 8122113 DOI: 10.1126/science.8122113

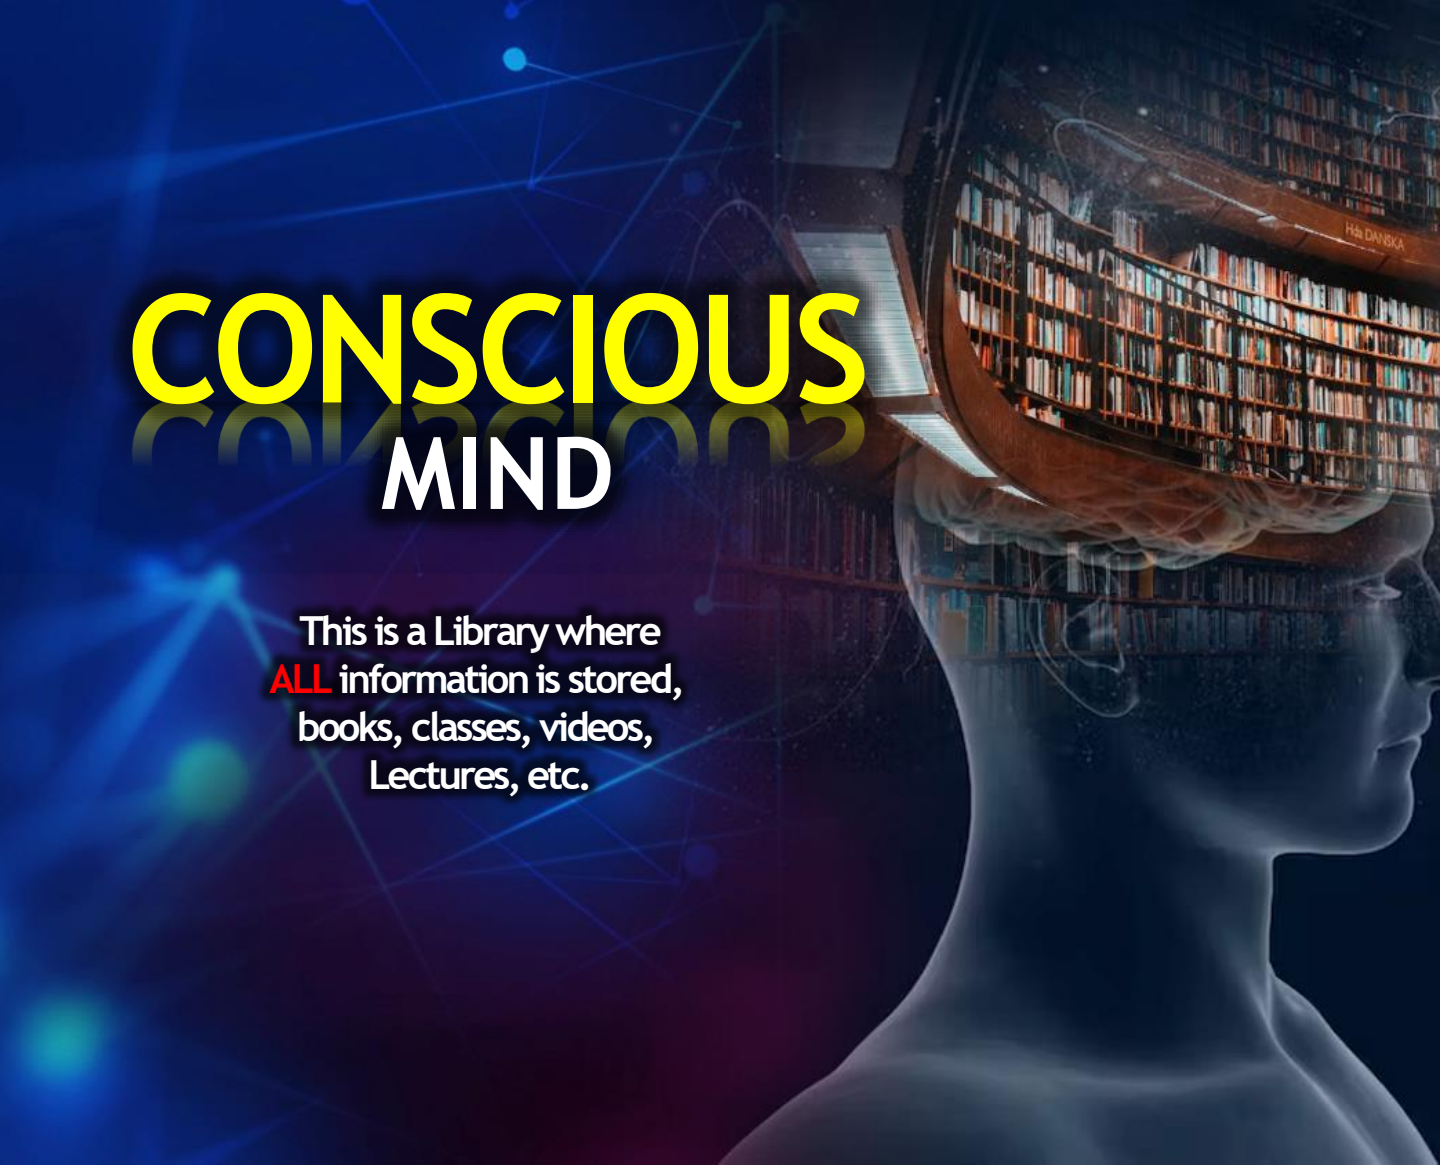

Abstract

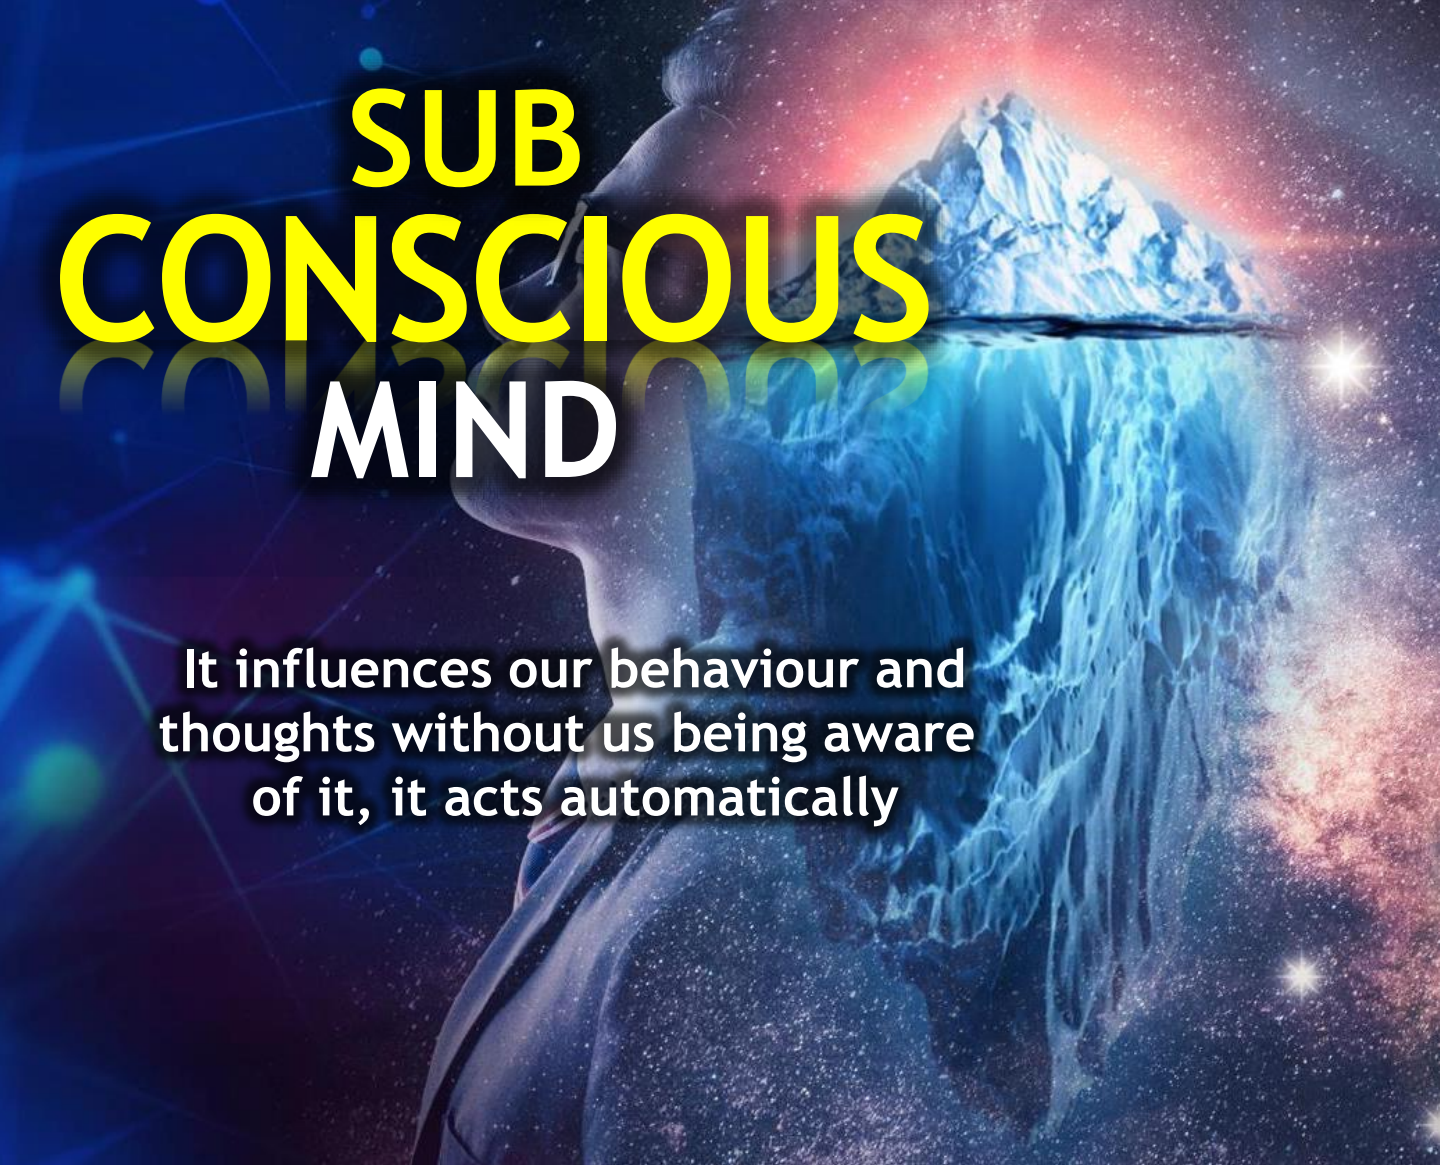

The excitability of the human motor cortex during the development of implicit and declarative knowledge of a motor task was examined. During a serial reaction time test, subjects developed implicit knowledge of the test sequence, which was reflected by diminishing response times. Motor cortical mapping with transcranial magnetic stimulation revealed that the cortical output maps to the muscles involved in the task became progressively larger until explicit knowledge was achieved, after which they returned to their baseline topography. These results illustrate the rapid functional plasticity of cortical outputs associated with learning and with the transfer of knowledge from an implicit to explicit state.

Dental flossing and automaticity: a longitudinal moderated mediation analysis

PMID: 28931305 DOI: 10.1080/13548506.2017.1381339

Abstract

We investigated the role of normative support, behavioural automaticity, and action control in predicting dental flossing behaviour. Between May and October 2015, 629 Australian young adults completed a questionnaire assessing constructs of normative support and automaticity, and a 2-week follow-up of dental flossing behaviour and action control, resulting in n = 241 persons for longitudinal analysis. Findings supported the hypotheses that the effect of normative support on behaviour would be mediated via automaticity, and the effect of automaticity would be moderated by action control. Current results extend previous research to elucidate the mechanisms that help to understand predictors of oral hygiene behaviours and contribute to the cumulative evidence concerning self-regulatory and automatic components of health behaviour.

Time to Form a Habit: A Systematic Review and Meta-Analysis of Health Behaviour Habit Formation and Its Determinants

Ben Singh [1,*], Andrew Murphy [1], Carol Maher [1], Ashleigh E Smith [1]

Editors: Joaquim Carreras[1], Mirja Hirvensalo[1]

Abstract

Background: Healthy lifestyles depend on forming crucial habits through the process of habit formation, emphasising the need to establish positive habits and break negative ones for lasting behaviour changes. This systematic review aims to explore the time required for developing health-related habits. **Methods:** Six databases (Scopus, PsychINFO, CINAHL, EMBASE, Medline and PubMed) were searched to identify experimental intervention studies assessing self-report habit or automaticity questionnaires (e.g., the self-report habit index (SRHI) or the self-report behavioural automaticity index (SRBAI)), or the duration to reach automaticity in health-related behaviours. Habit formation determinants were also evaluated. Meta-analysis was performed to assess the change in the SRHI or SRBAI habit scores between pre- and post-intervention, and the study quality was assessed using the PEDro scale. **Results:** A total of 20 studies involving 2601 participants (mean age range: 21.5–73.5 years) were included. Most studies had a high risk of bias rating (n = 11). Health behaviours included physical activity (n = 8), drinking water (n = 2), vitamin consumption (n = 1), flossing (n = 3), healthy diet (n = 8), microwaving a dishcloth (for foodborne disease reduction, n = 2), and sedentary behaviour reduction (n = 1). Four studies reported the median or mean times to reach habit formation, ranging from 59–66 days (median) and 106–154 days (means), with substantial individual variability (4–335 days). The meta-
